

Diabetes Dataset Analysis

What health factors matter for diabetes?

Agenda:

1. Introduce the dataset
2. Categorical Analysis
3. Numerical Analysis
4. Conclusion

ldl
family_history
hypertension
diet_type
whr
medication_use
bmi
triglycerides
glucose
blood_pressure
hd1
hb_a1c
hip_circumference
waist_circumference

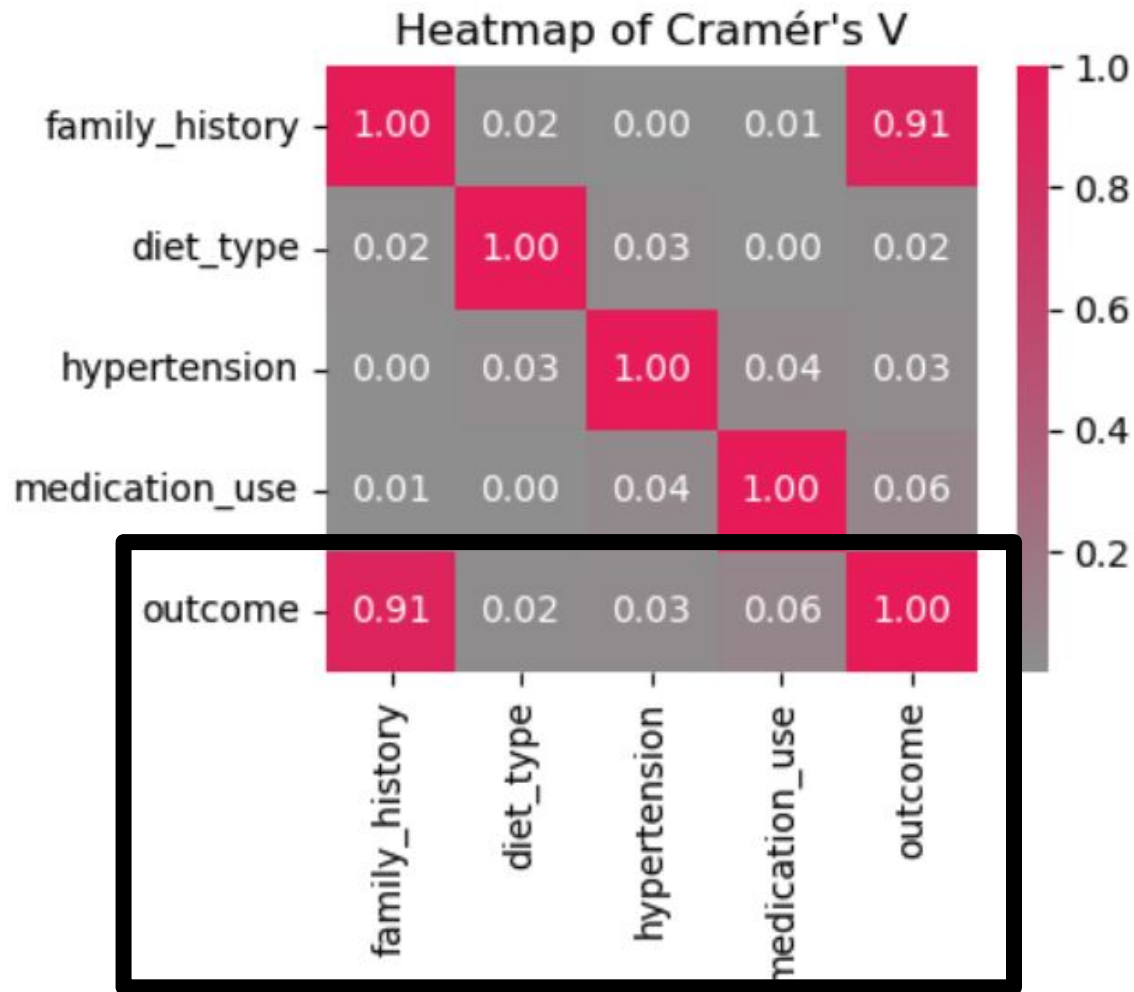

The Dataset:

- from www.kaggle.com
- 9538 patient entries
 - ~34% have diabetes (3282)
 - ~66% have no diabetes (6256)
- 17 columns check health factors, lifestyle and genetic factors for diabetes

Categorical Analysis [Chi-square p]

Categorical Analysis [Cramér's V]

family_history
outcome

Chi-square p value is 0
Cramér's Value is 0.91

- We can reject H_0 that the two values are independent
- There is a strong association between both values

family_history outcome

		Absolute Frequency	Relative Frequency
Diabetes	Family History		
False	False	6256	100.0
True	False	397	12.1
	True	2885	87.9

Numerical Analysis [Spearman]

Numerical Analysis [Pearson]

HbA1c Glucose

HbA1c

GLUCOSE

CONCLUSION

1. Only Family History is strongly associated with having Diabetes
2. Only Glucose is correlated with long term blood sugar HbA1c

My Wish

A more differentiated outcome with Diabetes Type I or II, Pre-Diabetic etc.

A binary column did not allow to collect many results.

Thank You
